

Creating a Simple Network With ENPEP for Windows

Creating a Simple Network

In this Exercise you will create a Simple network consisting of:

1. two resource nodes (oil & coal),
2. two conversion processes (boilers HP1 and HP2),
3. one decision node (AL), and
4. one demand node (HD1).

Study period: 1998-2017

Steps in Network Development

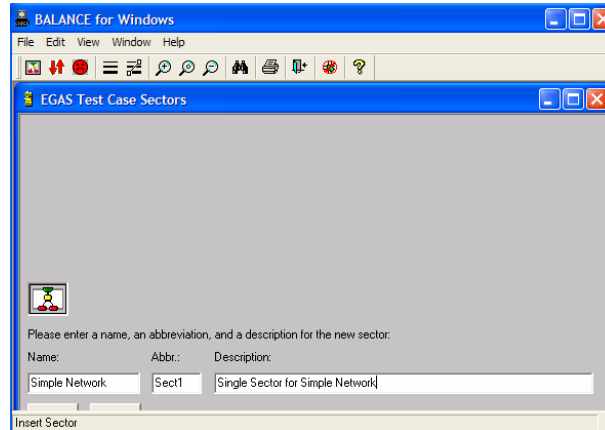

1. Network/data preparation:
 - network drawing & labeling
 - data definition
 - check of base year quantities & prices
2. Prepare (run/check) the node visitation sequence
3. Run BALANCE
4. Check/printout the results (tables/graphs/DOS files)

Creating a Sector within a Network

1. Open new test case.

2. Click on sector icon, then click in center of EGAS Test Case to create a sector .

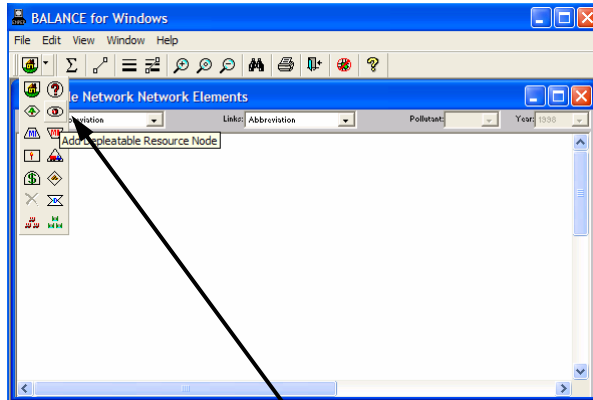

3. Enter sector Name, Abbr. and Description, then click "OK" .

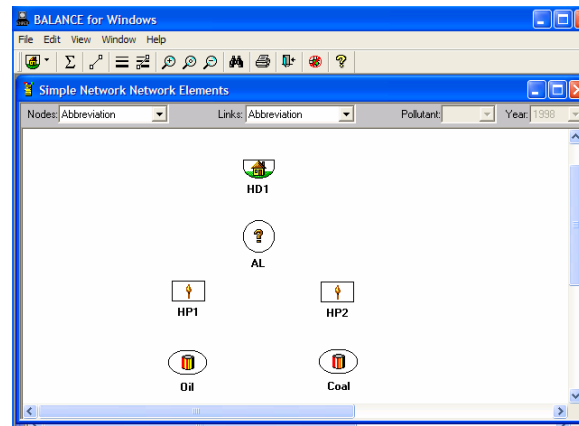

4. Double-click on Sect1 sector icon to open this sector.

Creating Nodes within a Sector

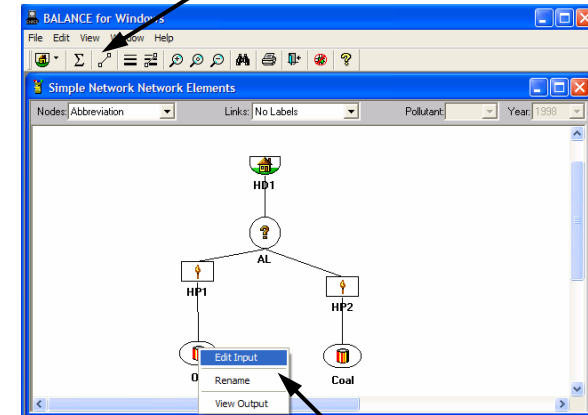

1. Click on depletable resource node, then click in center of Sect1 sector to add two resource nodes.

2. Enter all nodes with Name, Abbreviation and Description.

3. Click on Add Link icon, then draw links between the nodes.

4. Right-click on each node to add the data specified in the following tables for different cases (i.e. for different runs of the model).

Data Sheet for Simple Network

Depletable Resources Data

Case	Resource	Annual Capacity Limit (kBOE)	Base Year Production (kBOE)	Intercept of Supply Curve (price) (\$/BOE)	Slope of Supply Curve	Price Growth Rate (Fract.)
	Oil	1000000	500	20	0	0
1-16	Coal	1000000	500	10	0	0
	Oil	1000000	500	20	0	0.02
17	Coal	1000000	500	10	0	0.04

Data Sheet for Simple Network

Conversion Process Data

Case	Process Name	Single Plant Capacity (kBOE)	All Plant Capacity (kBOE)	Capacity Factor (Fract.)	Efficiency (Fract.)	O&M Cost (\$/BOE)	Single Plant Inv. (\$1000)	Econ. Life (Years)	Int. Rate (Fract.)
1-8	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.8	0.8	0	0	30	0.1
9	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.8	0.8	2	0	30	0.1
10	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.8	0.8	2	5000	30	0.1
11	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.4	0.8	2	5000	30	0.1
12	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.4	0.6	2	5000	30	0.1
13	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.4	0.6	2	5000	30	0.05
14	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.4	0.6	2	5000	40	0.05
15	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.4	0.6	2	+10000	40	0.05
16-17	HP1	100	100000000	0.8	0.8	0	0	30	0.1
	HP2	100	100000000	0.8	0.8	0	0	30	0.1

Data Sheet for Simple Network

Decision Node Data (AL)

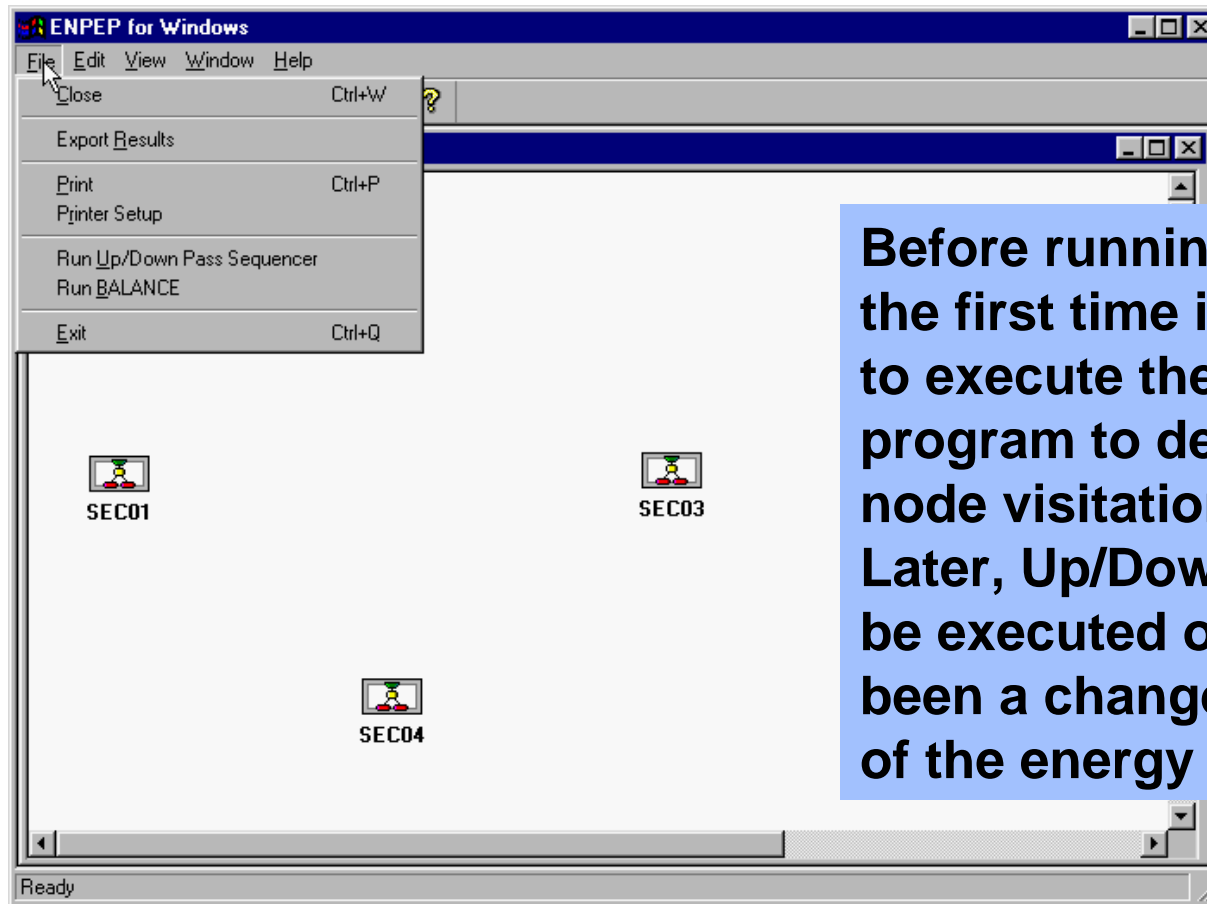

Case	Base	Priority Link		Premium Multiplier		Price	Lag
	Year					Sensit.	Parameter
	Split (Fract.)	H-C	H-O	H-C	H-O	(0-15)	(0-1)
1-3	1	0	0	0	0	0	0
4	1	0	0	0	0	5	0.5
5	1	0	0	0	0	2	0.1
6	1	0	0	0	0	2	0.9
7	1	0	0	1	0.8	5	0.5
8	1	1	2	0	0	2	0.9
9-17	1	0	0	0	0	5	0.5

Data Sheet for Simple Network

Demand Node Data

		Growth
	Demand	Rate
Case	Node	(Fraction)
1	HD1	0
2	HD1	0.05
3-17	HD1	0

Execution of BALANCE Module is performed in two steps: node visitation => network calculation

Before running BALANCE for the first time it is necessary to execute the Up/Down Pass program to determine the node visitation sequence. Later, Up/Down Pass should be executed only if there has been a change in the structure of the energy network.

BALANCE Produces a Simulation Status Report for the Up/Down Pass Sequencer

Case 1: Definition of node visitation sequences

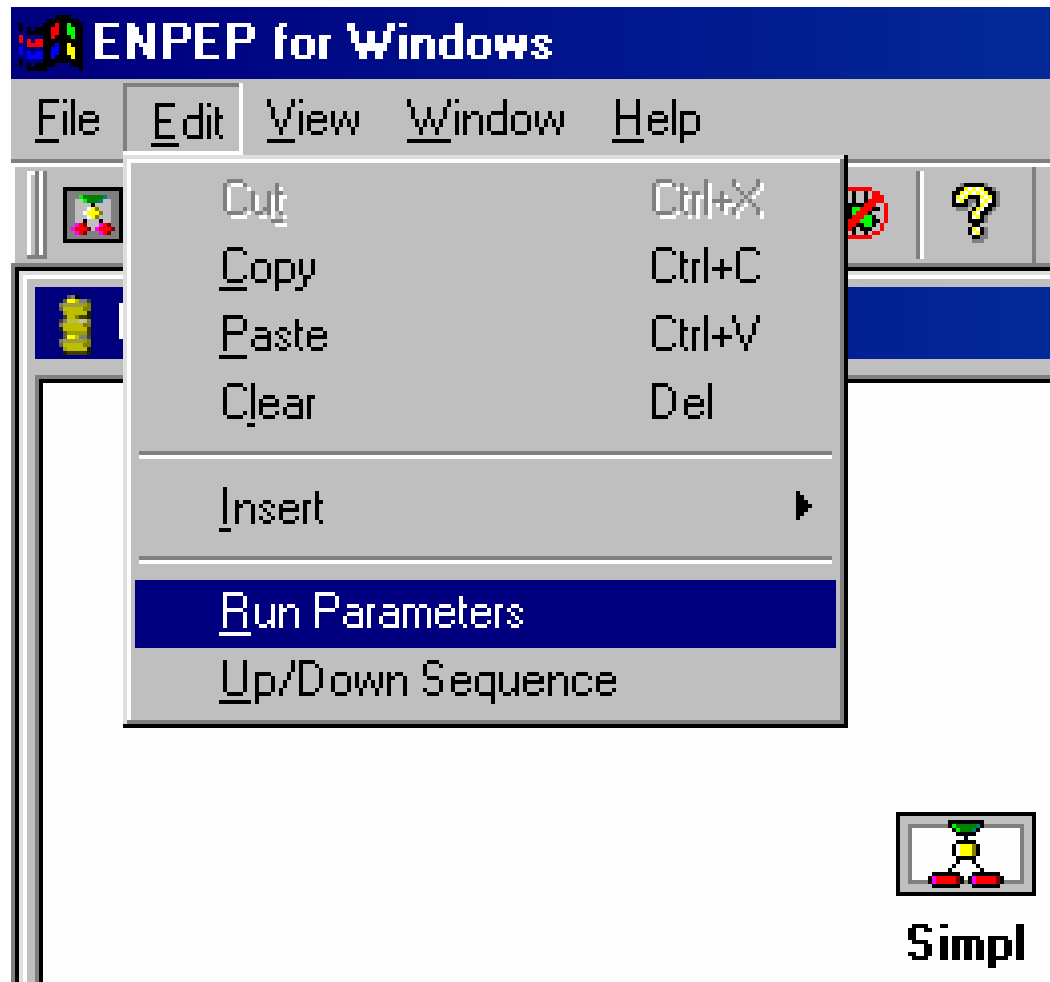

UP-PASS

DOWN-PASS

In addition to the Up/Down sequence, Run parameters may be necessary to check/modify

Run Parameters Allow the User to Select The Convergence Tolerance Level

Illis Case Properties

Run Parameters | Output Codes | Non-electric Units | Electric Units

Convergence Parameters:

Relative Tolerance:	<input type="text" value="0.100"/>	(Fraction)
Absolute Tolerance:	<input type="text" value="10.000"/>	(kBOE)
Maximum Iterations:	<input type="text" value="10"/>	(1-100)
Lower Bound Relaxation Range:	<input type="text" value="0.100"/>	
Upper Bound Relaxation Range:	<input type="text" value="0.900"/>	

The model will stop running after the specified number of iterations in a year

Relaxation parameters for adjusting values between iterations

Input the tolerance level in both percent and absolute terms

The User Can Specify the Units To Be Displayed

Chose this folder to change units

Default unit

Default units are divided by the conversion factor

<u>Unit Type</u>	<u>Default Unit</u>	<u>Unit Name</u>	<u>Unit Conversion Factor</u>	<u>Unit Description</u>
Energy Quantities/Capacities	kBOE	TJ	0.172	TeraJoules
Energy Prices	US \$/BOE	\$/GJ	5.814	US Dollars per GigaJoule
Costs	US \$1000	\$1000	1.000	Thousands of US Dollars

Select a predefined unit or define a new one

These factors are used to convert values from the default value to the user specified unit

Similar procedure is used for both non-electric and electric units

Run Parameters	Output Codes	Non-electric Units	Electric Units	
<u>Unit Type</u>	<u>Default Unit</u>	<u>Unit Name</u>	<u>Unit Conversion Factor</u>	<u>Unit Description</u>
Base Year Production	kBOE			
Thermal Capacity	MW	GJ	1.000	MegaWatt
Hydro Capacity	MW-Year	kBOE	1.000	MegaWatt-Year
Capital Cost	\$/kW	TCE	1.000	US Dollars per KiloWatt
Fixed O&M Cost	\$/kW-Year	TJ	1.000	US Dollars per KiloWatt-Year
Variable O&M Cost	\$/MWh	TOE	1.000	US Dollars per MegaWatt-hour
Opt. Loading Order	\$/MWh	\$/MWh	1.000	US Dollars per MegaWatt-hour
Heat Rate	BTU/kWh	BTU/kWh	1.000	British Thermal Units per KiloWatt-hour

Reporting can be managed by output codes

The screenshot displays the 'ENPEP for Windows' application window. The 'BAL-S Case Properties' dialog box is open, with the 'Output Codes' tab selected. The dialog contains a table for defining output codes and several checkboxes for selecting output types.

	Start Year	End Year	Step	Start Iteration	End Iteration
Converged Price/Quantity Results:	2000	2019	1		
Converged Electric Sector Results:	2000	2019	1		
Diagnostic Price/Quantity calculations:	2000	2019	1	1	10
Diagnostic Electric Sector Calculations:	2000	2019	1	1	10

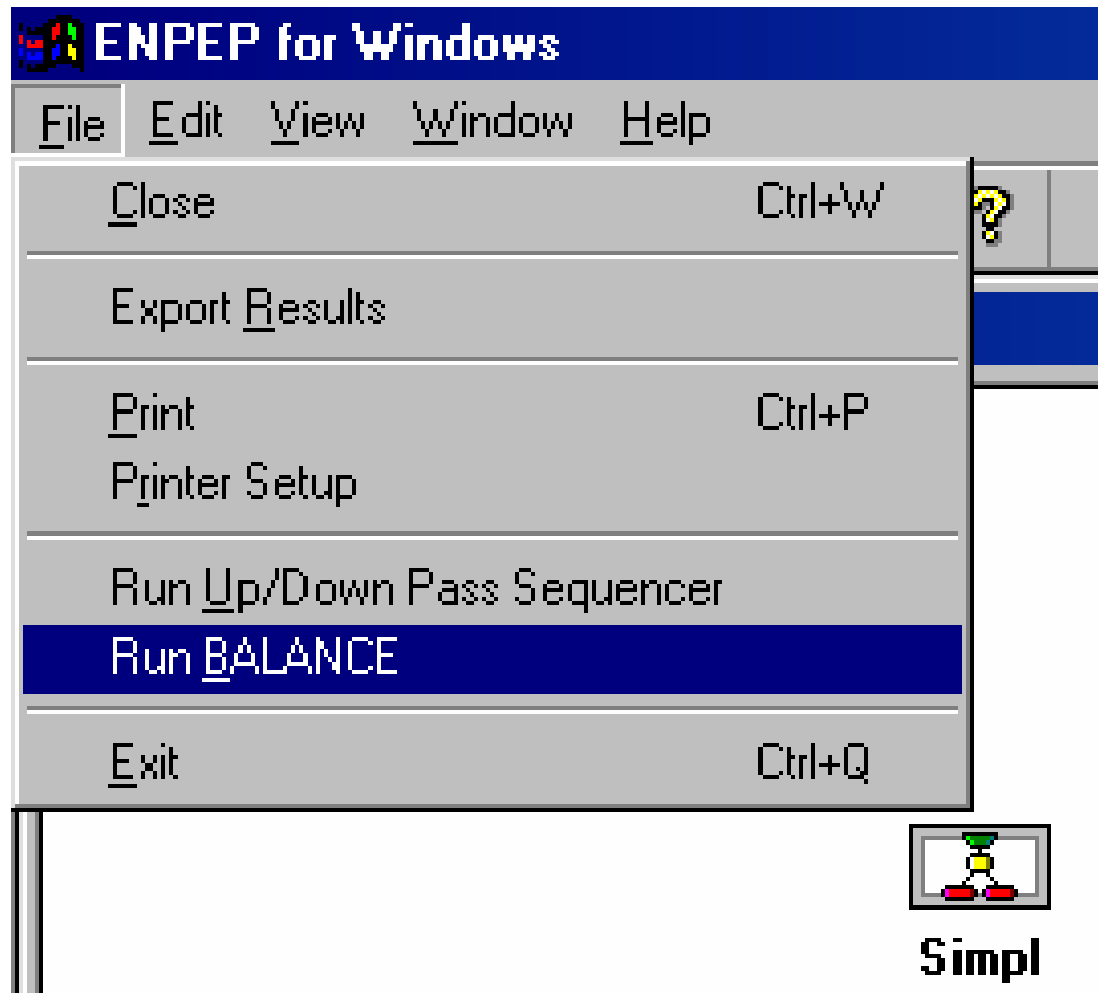

Diagnostic Output to be Generated:

- Non-electric: Node Sequence Node Calculations Market Share
- Electric: Detailed Electric Sector Iteration Calculations
- Input Data:

Buttons: OK, Cancel, Add, Delete

Taskbar: Ready, Office, ENPEPWIN Cases, Microsoft PowerPoint..., ENPEP for Wind..., 17:39

To Run the Model Select *Run BALANCE* Under the *File* List When You Are in the Sector Window

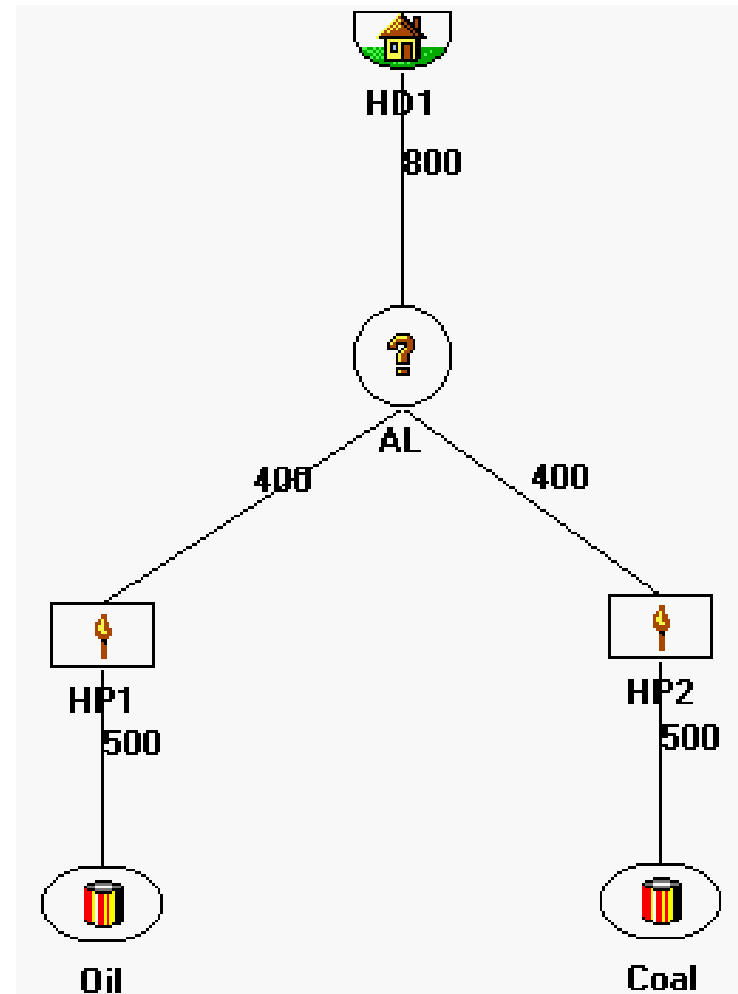

Case 1: Check of Base Year Energy Flows

Base Year energy flows
in kBOEs.

$$\text{AL: } Q_{\text{out}_t} = \sum Q_{\text{in}_{(t,l)}} = 400 + 400 = 800$$

$$\begin{aligned} \text{PR: } Q_{\text{out}_t} &= Q_{\text{in}_t} \times f \\ &= 500 \times 0.8 = 400 \end{aligned}$$

$$\text{RS: } Q_{\text{out}_0} = \text{user-specified} = 500$$

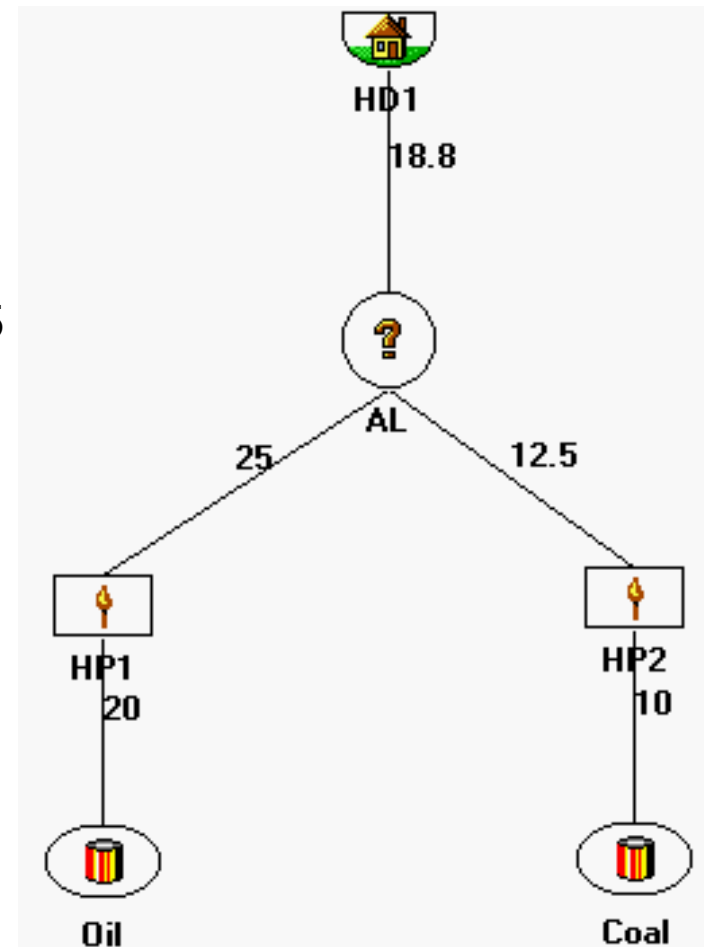

Case 1: Check of Base Year Energy Prices

Base Year energy prices
in U.S.\$/BOE

$$\begin{aligned} \text{AL: } P_{out_t} &= \sum [P_l \times S_l] \\ &= 25 \times 0.5 + 12.5 \times 0.5 = 18.75 \end{aligned}$$

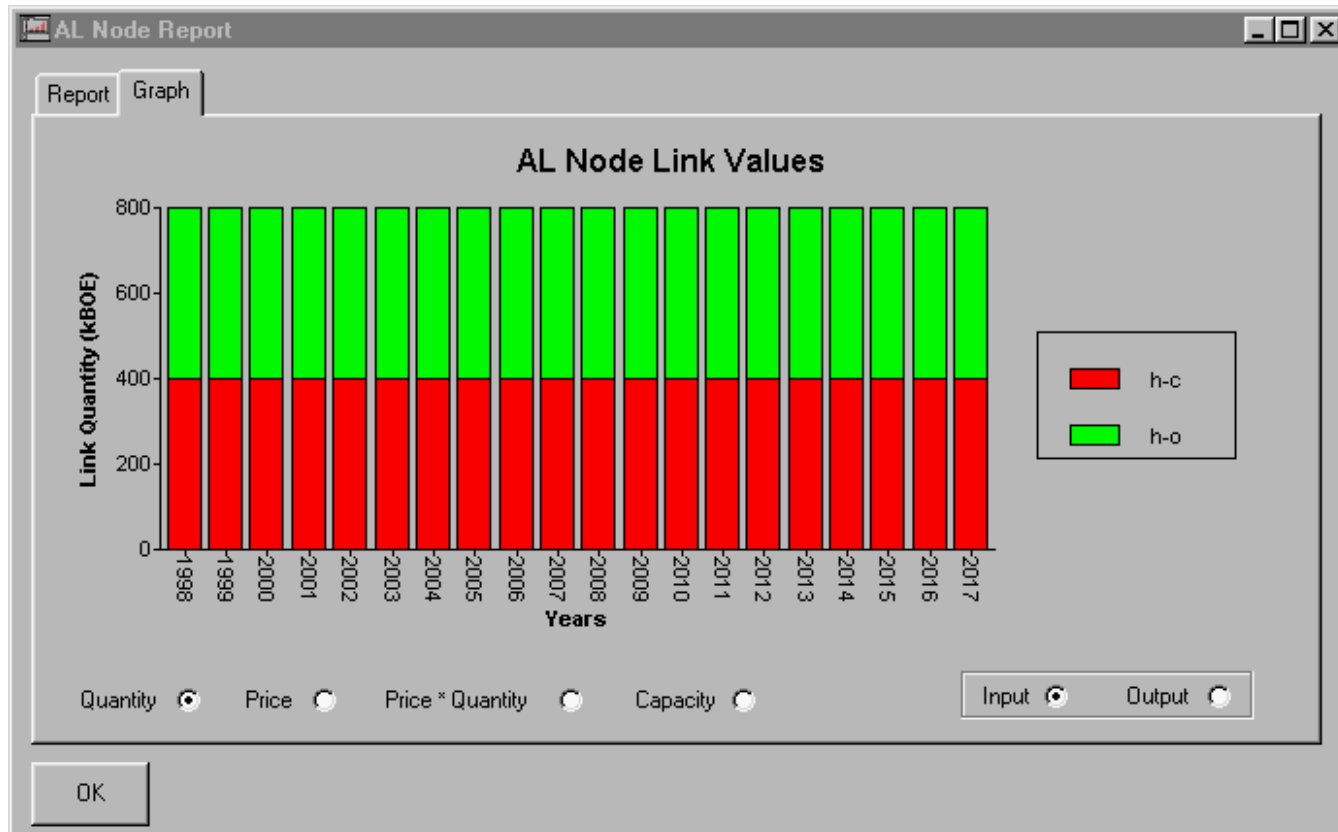

$$\begin{aligned} \text{PR: } P_{out_t} &= P_{in_t}/f + \text{OM} + \\ &\quad + [TCI/(CAP \times CF)] \times \text{CRF}(i,n) \\ &= 20/0.8 = 25 \end{aligned}$$

$$\begin{aligned} \text{RS: } P_{out_t} &= A(Q_{out_{t-1}}) \times (1+R_t) + \\ &\quad + B \times Q_{out_t} + C \times Q_{out_t}^2 \\ &= 20 \times (1+0) = 20 \end{aligned}$$

Case 1 Results:

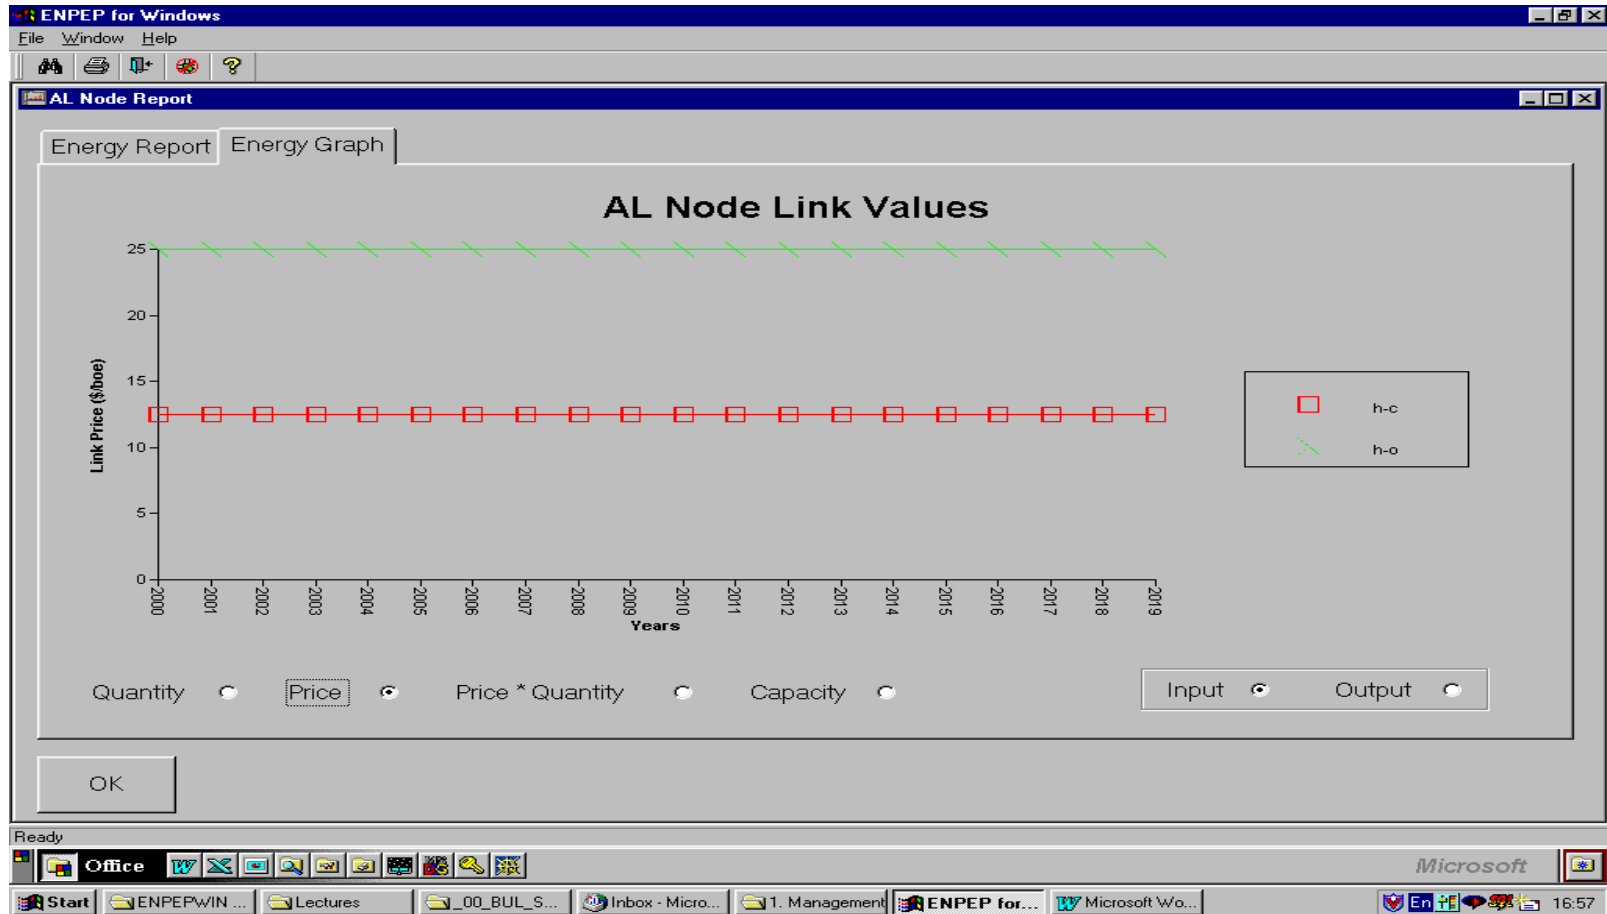

a) Check of the QUANTITIES in the Allocation Node

No demand growth specified over the study period; the quantities are equally distributed on input links (equal market shares) because no price sensitivity was specified.

Case 1 Results:

b) Check of the PRICES in the Allocation Node

The prices of heat generated using coal (12.5 \$/BOE) and oil (25 \$/BOE) are different, but the quantities are not affected.

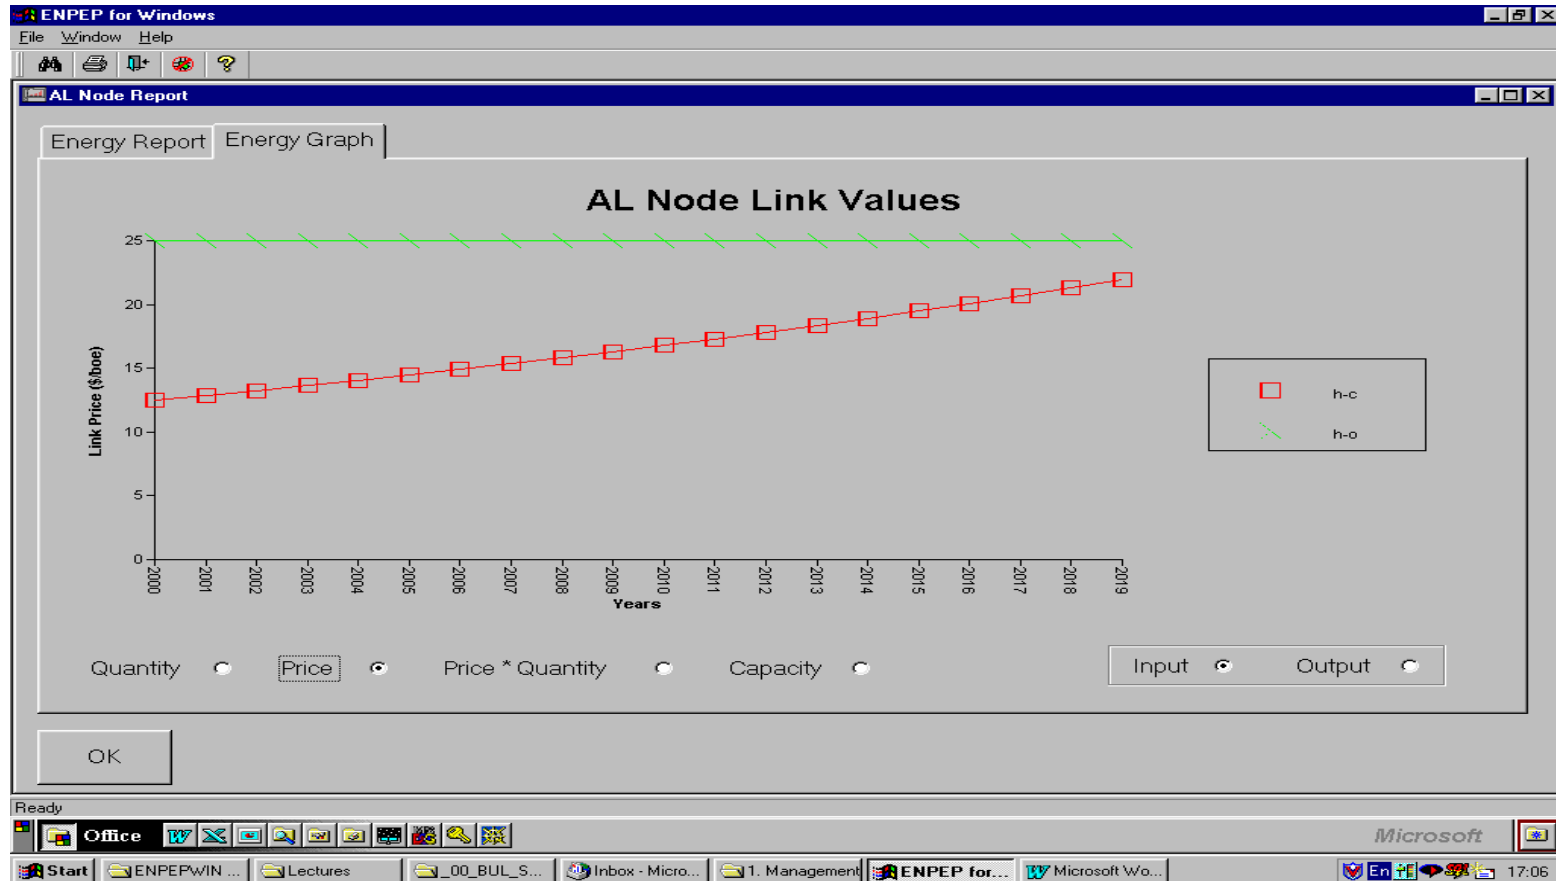

Changes in Case 1: cases 1-6

<i>Case</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>	<i>6</i>
Demand growth	0	5%	0	0	0	0
Price sensitivity	0	0	0	5	2	2
Lag factor	0	0	0	0.5	0.1	0.9
Resource (coal) price growth	0	0	3%	0	0	0

Case 2: Demand Growth Rate Specified at 5%

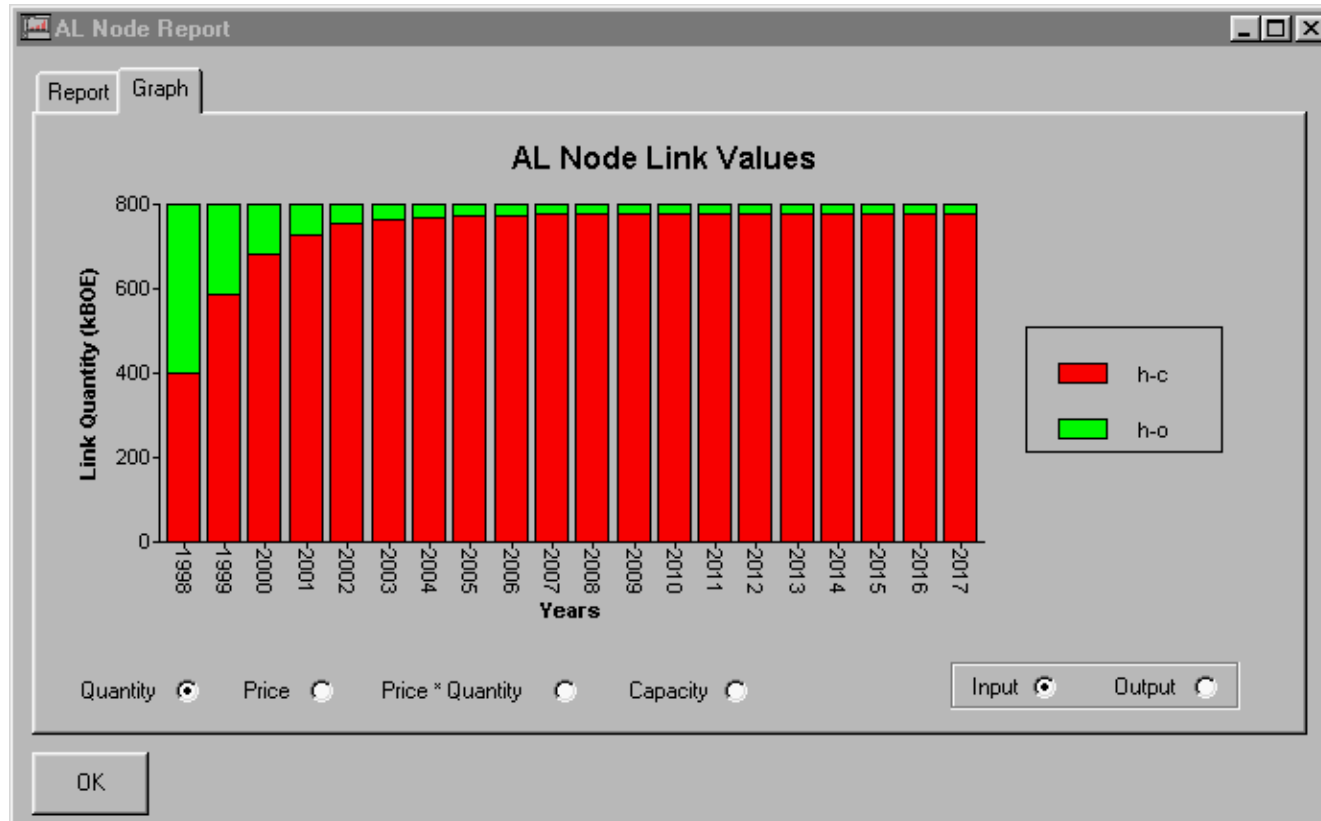

Case 3: Coal Price Increase 3% Per Year; No Demand Growth

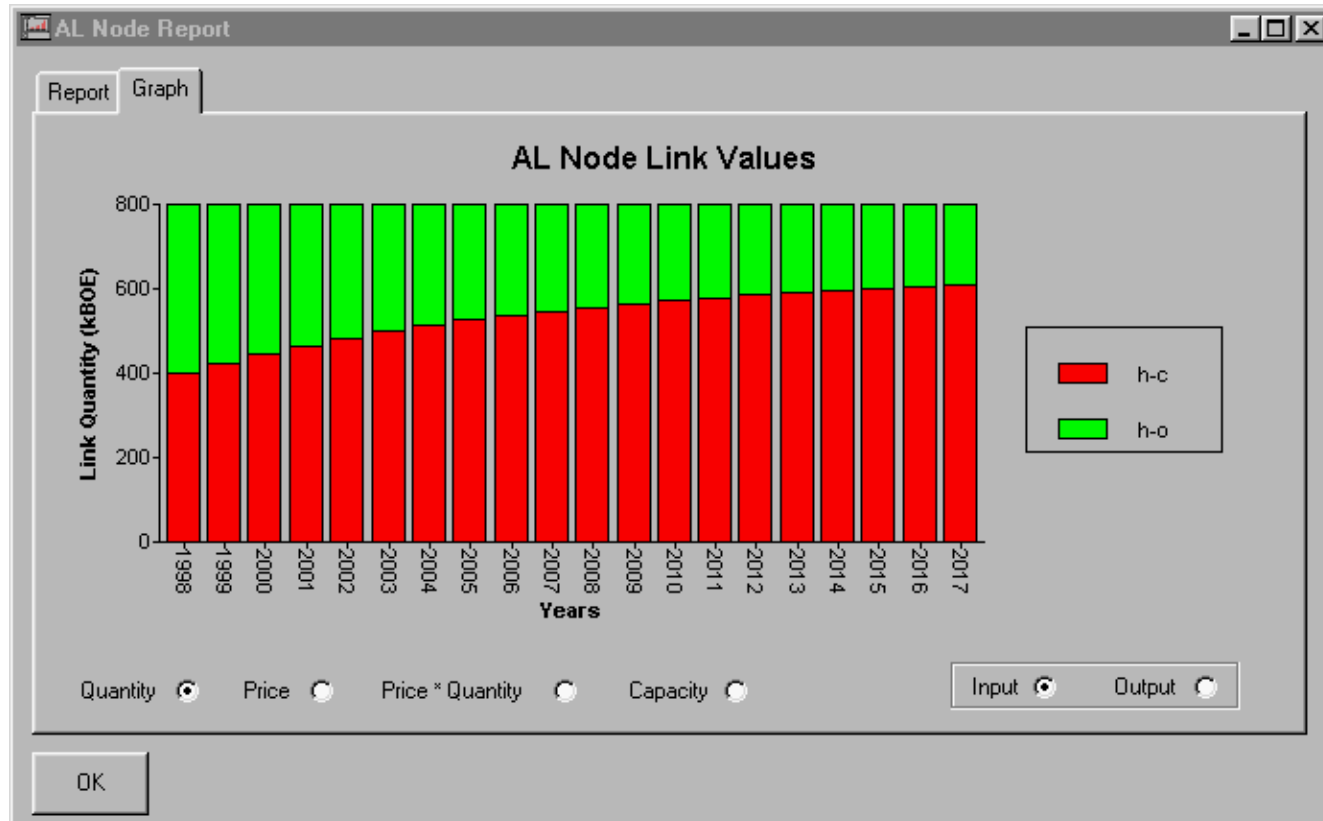

**Coal price increases 3% per year, oil prices remain constant.
The quantities of heat produced from both fuels remain equal
because there is no price sensitivity specified.**

Case 4: Price Sensitivity = 5; Lag Parameter = 0.5

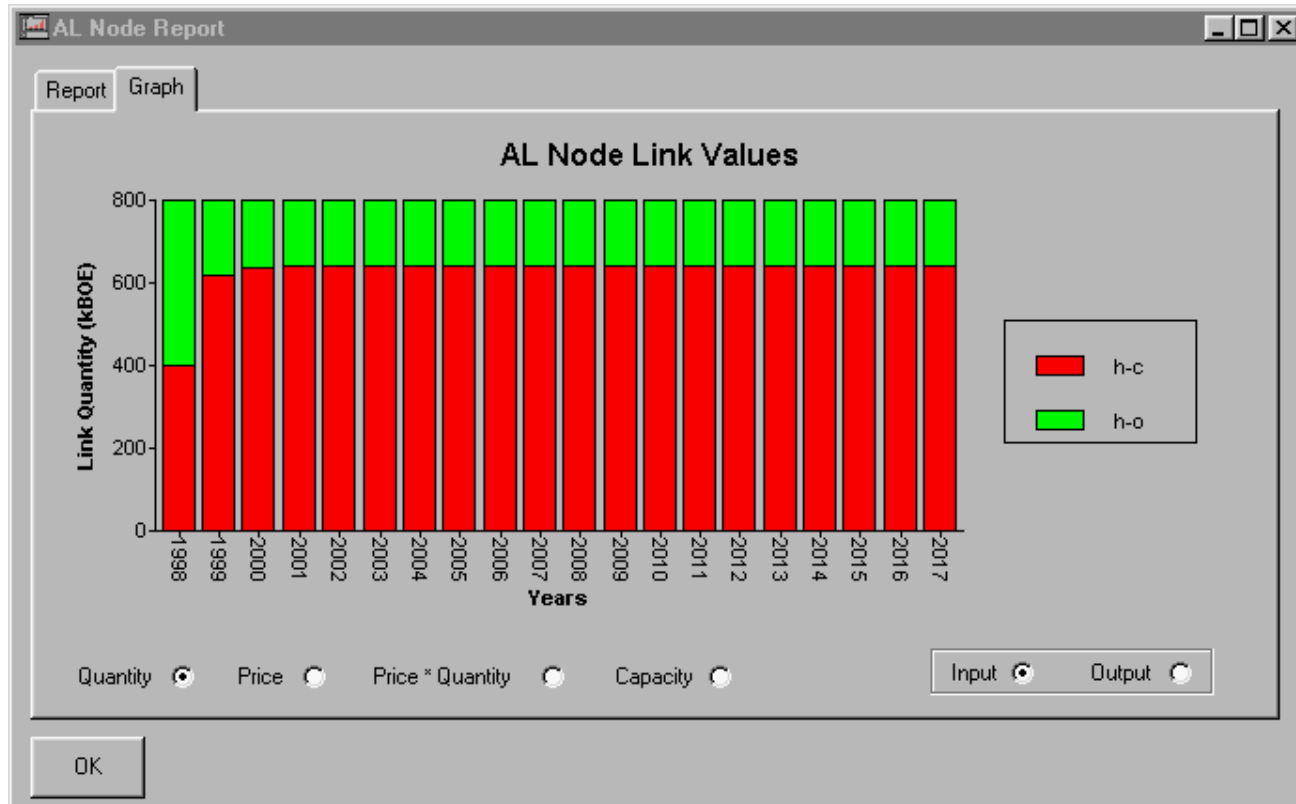

If the price sensitivity is specified, the cheaper fuel soon takes most of the market share.

Case 5: Price Sensitivity = 2; Lag Parameter = 0.1

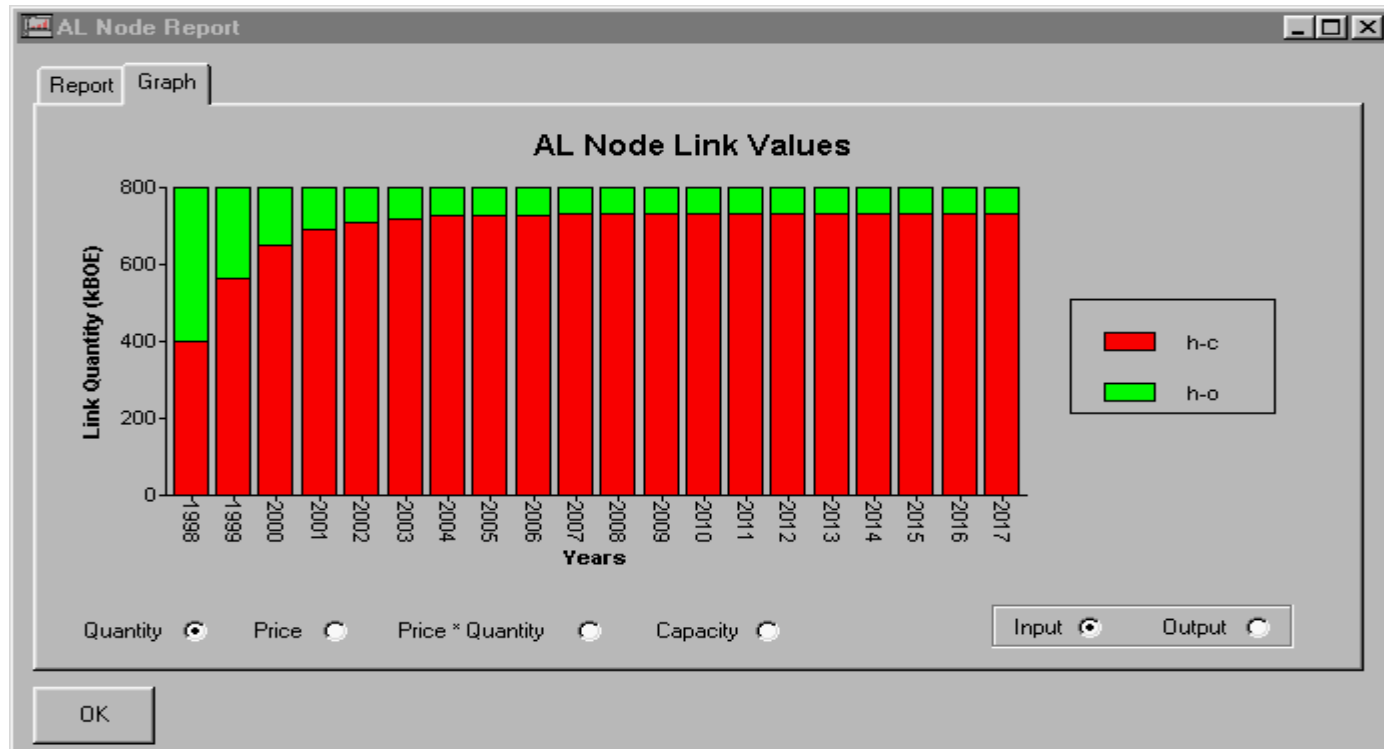

If the price sensitivity is low, the cheaper fuel does not completely dominate the market; the changes are slow because lag=0.1.

Case 6: Price Sensitivity = 2; Lag Parameter = 0.9

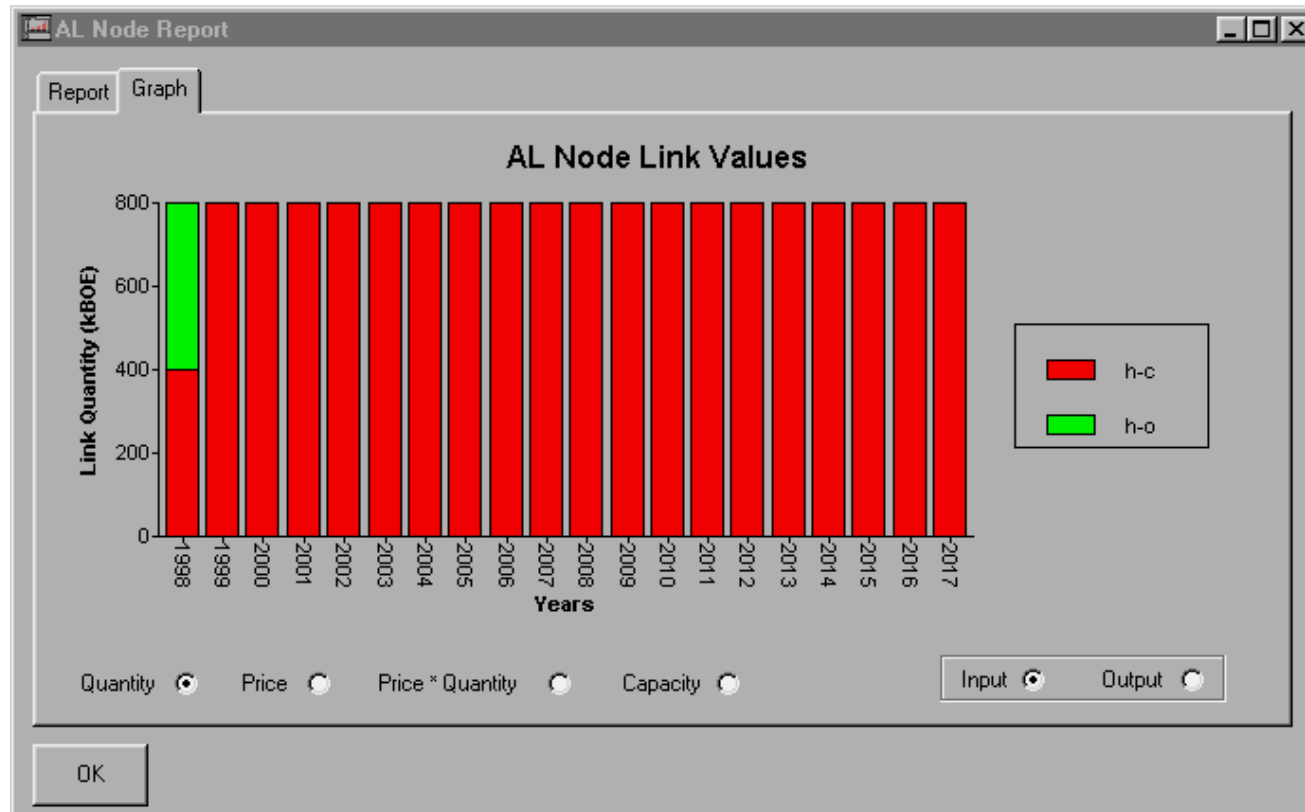

If the lag parameter is specified close to 1, the changes in the market share are achieved more quickly (but they are smaller than under $\gamma=5$ above).

Case 7: Premium Multipliers for Coal = 1, Oil = 0.8; Price Sensitivity = 5, Lag Parameter = 0.5

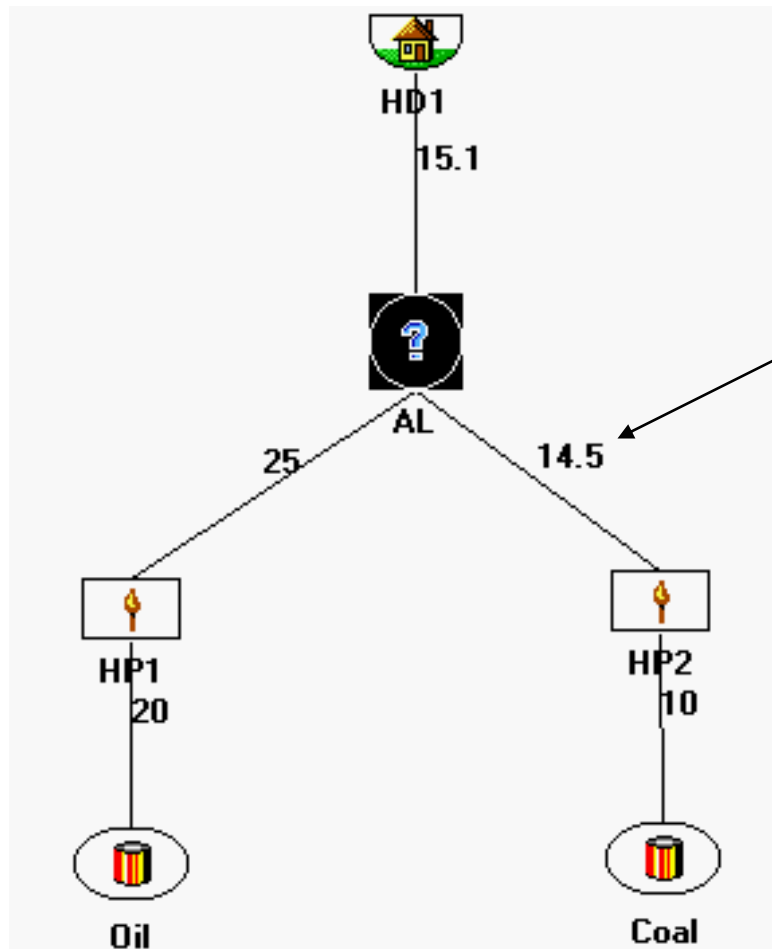

Because of the premium multiplier 0.8 specified for oil, its market share is now larger than in the Case 4.

Case 8: Priority Link H-C = 1

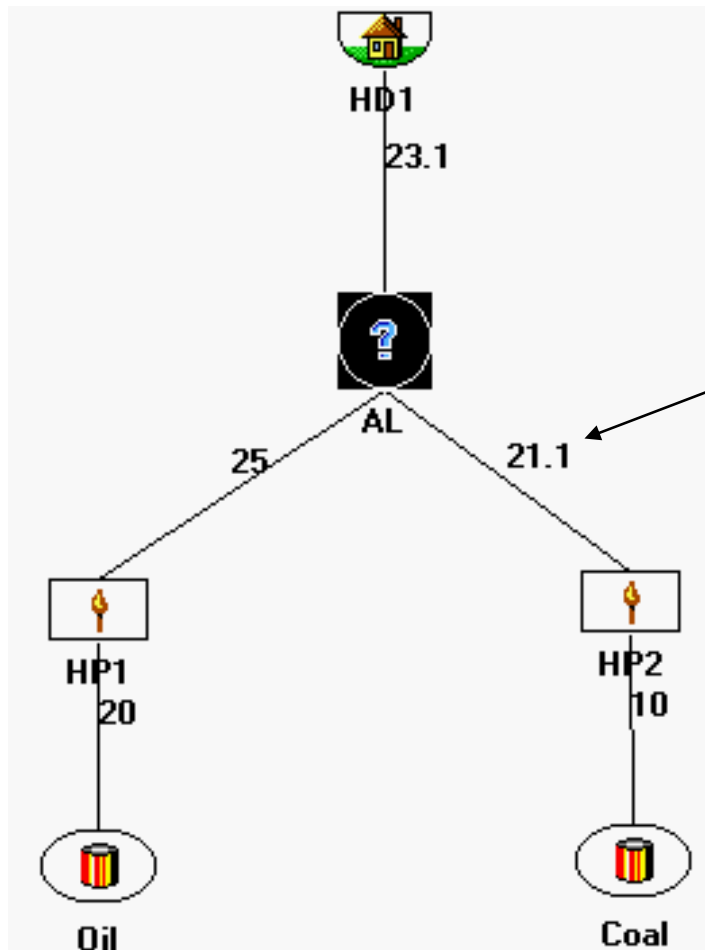

Except for the base year, for which the quantities are predefined, the priority link will be used up to its maximum capacity.

Case 9: Heat Plant 2 O&M Cost = 2 \$/BOE

The price on the link h-c increased from 12.5 to 14.5 \$/BOE.

Case 10: Single Plant Investment Cost = 5 Million Dollars, O&M = 2\$/BOE

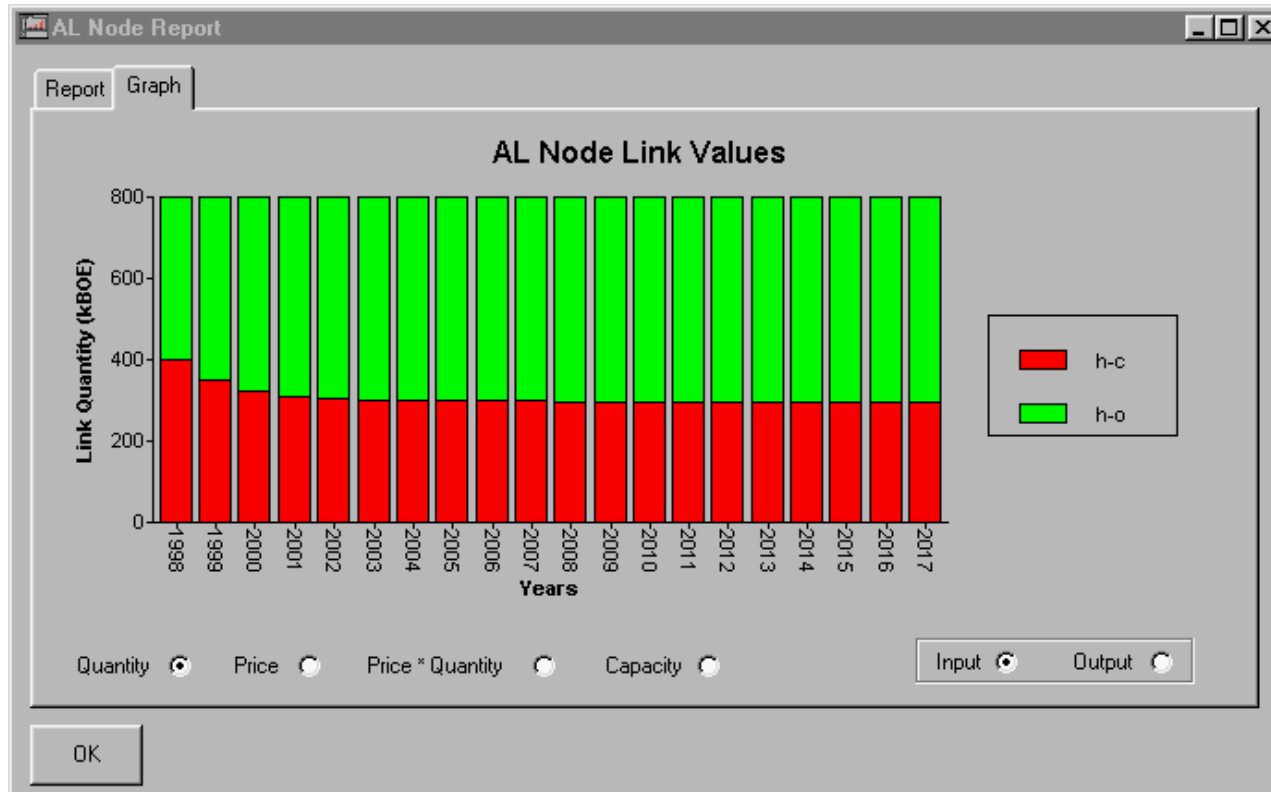

The price on the link h-c increased from 14.5 to 21.1 \$/BOE.

Case 11: HP2 Capacity Factor = 0.4

The price on the link h-c increased from 21.1 to 27.8 \$/BOE.

Case 11: HP2 Capacity Factor = 0.4

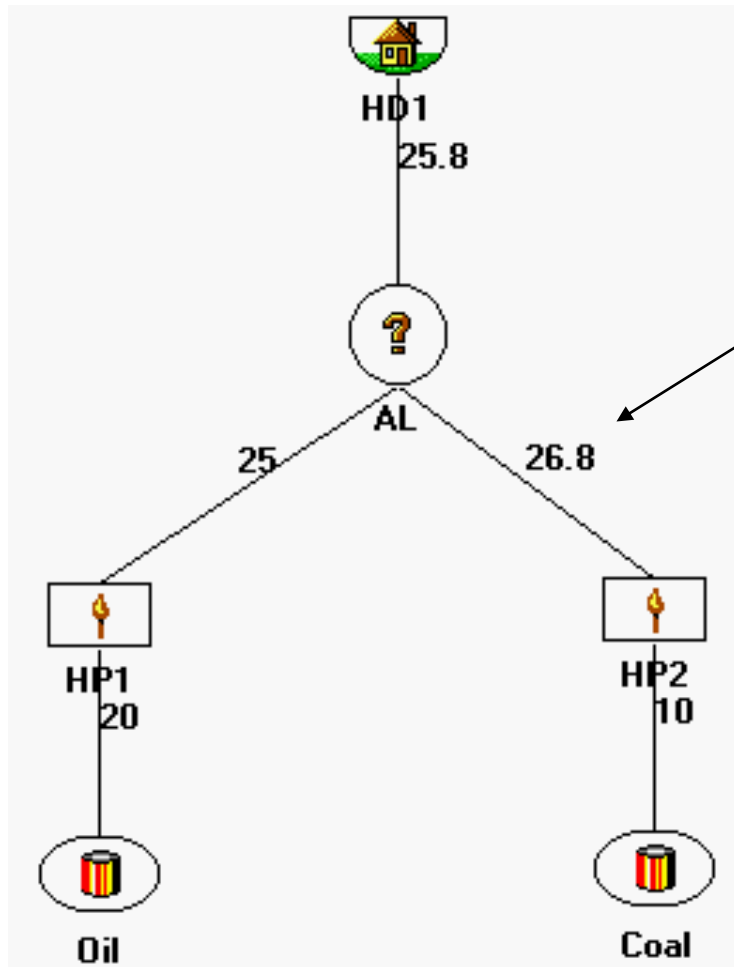

The price on link h-c is now higher than that on link h-o, so its market share decreases.

Case 12: HP2 Efficiency = 0.6, Capacity Factor 0.4

The price on the link
h-c increased from
27.8 to 31.9 \$/BOE.

Case 13: HP2 Interest Rate Decreases from 10% to 5%

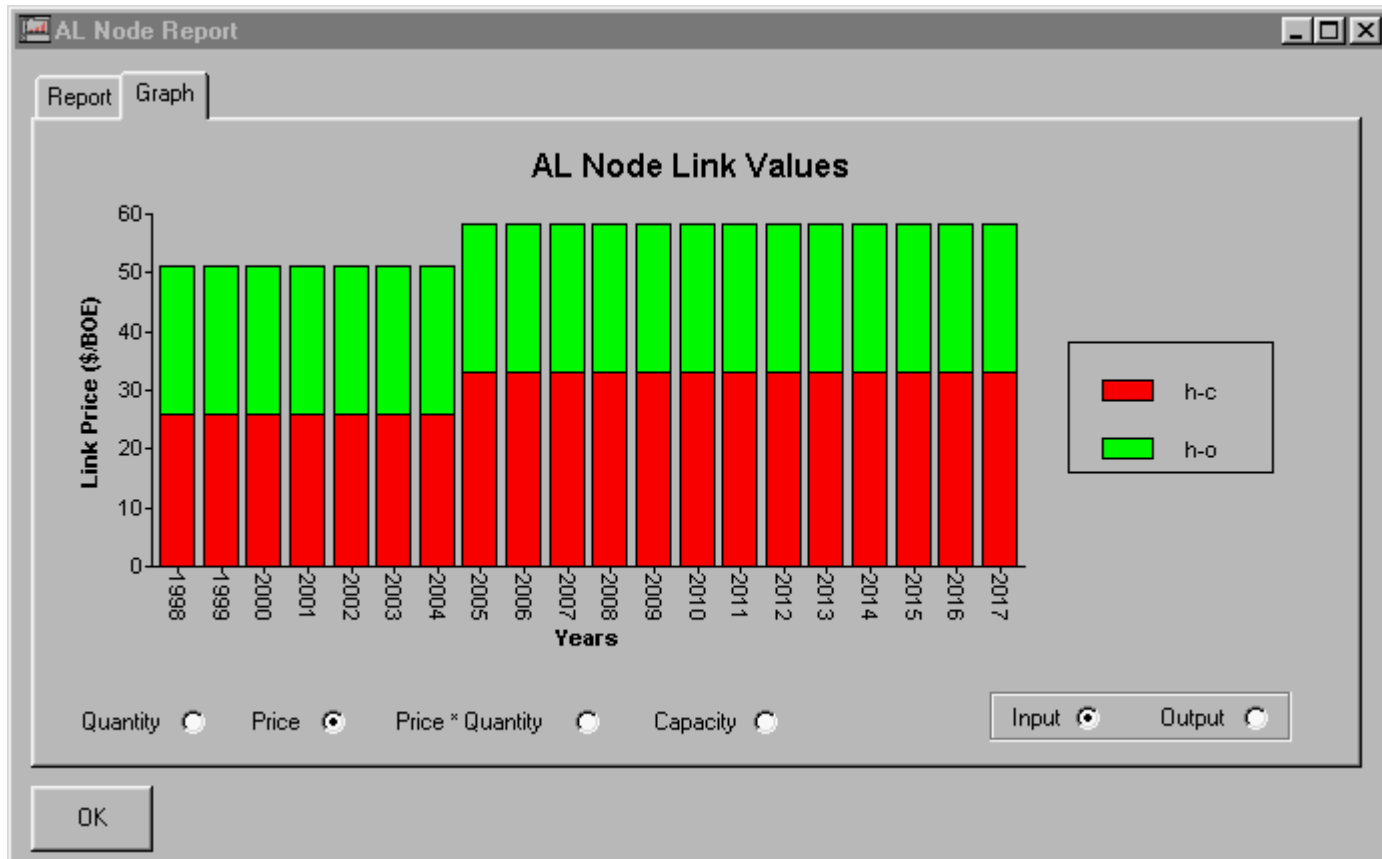

The price on the link h-c decreases from 31.9 to 26.8 \$/BOE.

Case 14: HP2 Economic Lifetime Increased from 30 to 40 Years

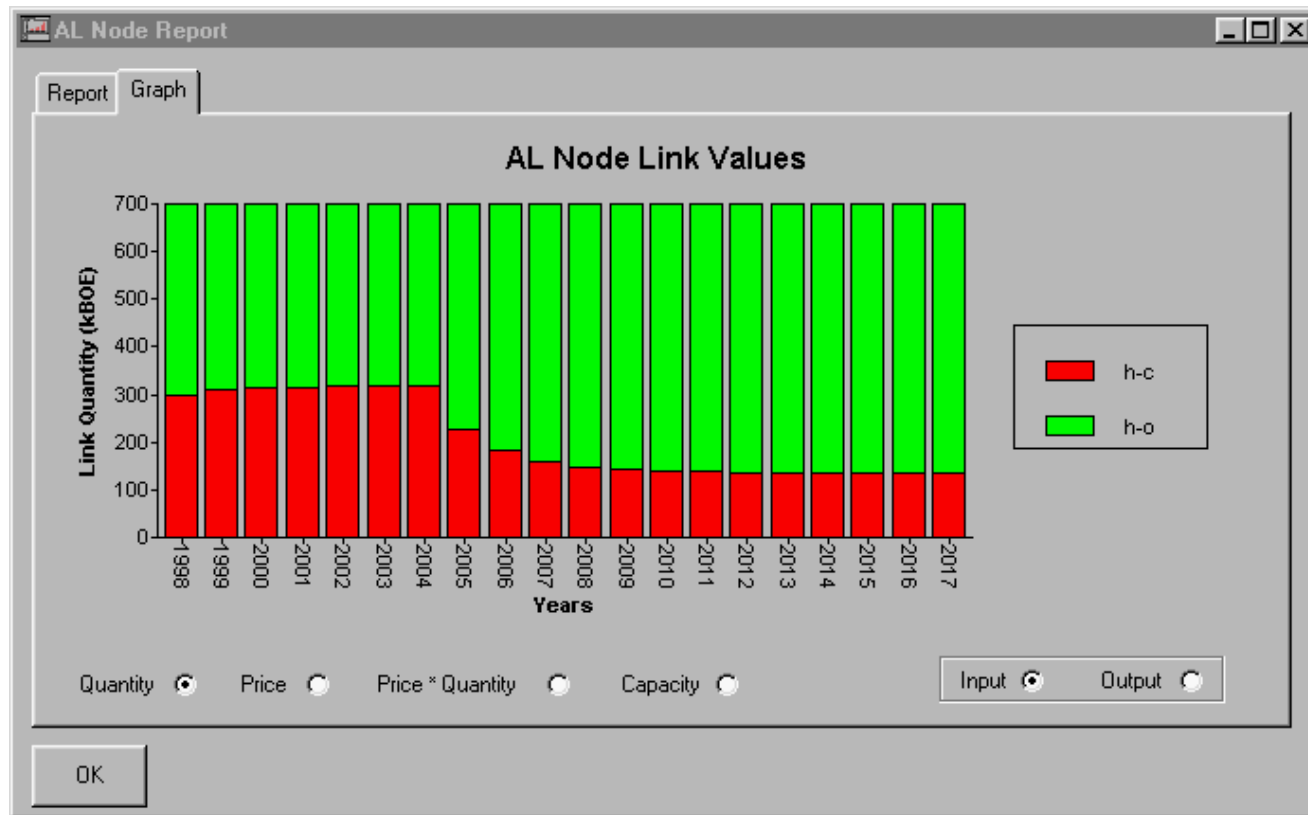

The price on the link h-c decreases from 26.8 to 26.0 \$/BOE.

Case 15: Addition of a New HP2 Unit in 2005, Investment Cost = 10 Million Dollars

The price on the link h-c increases from 2005.

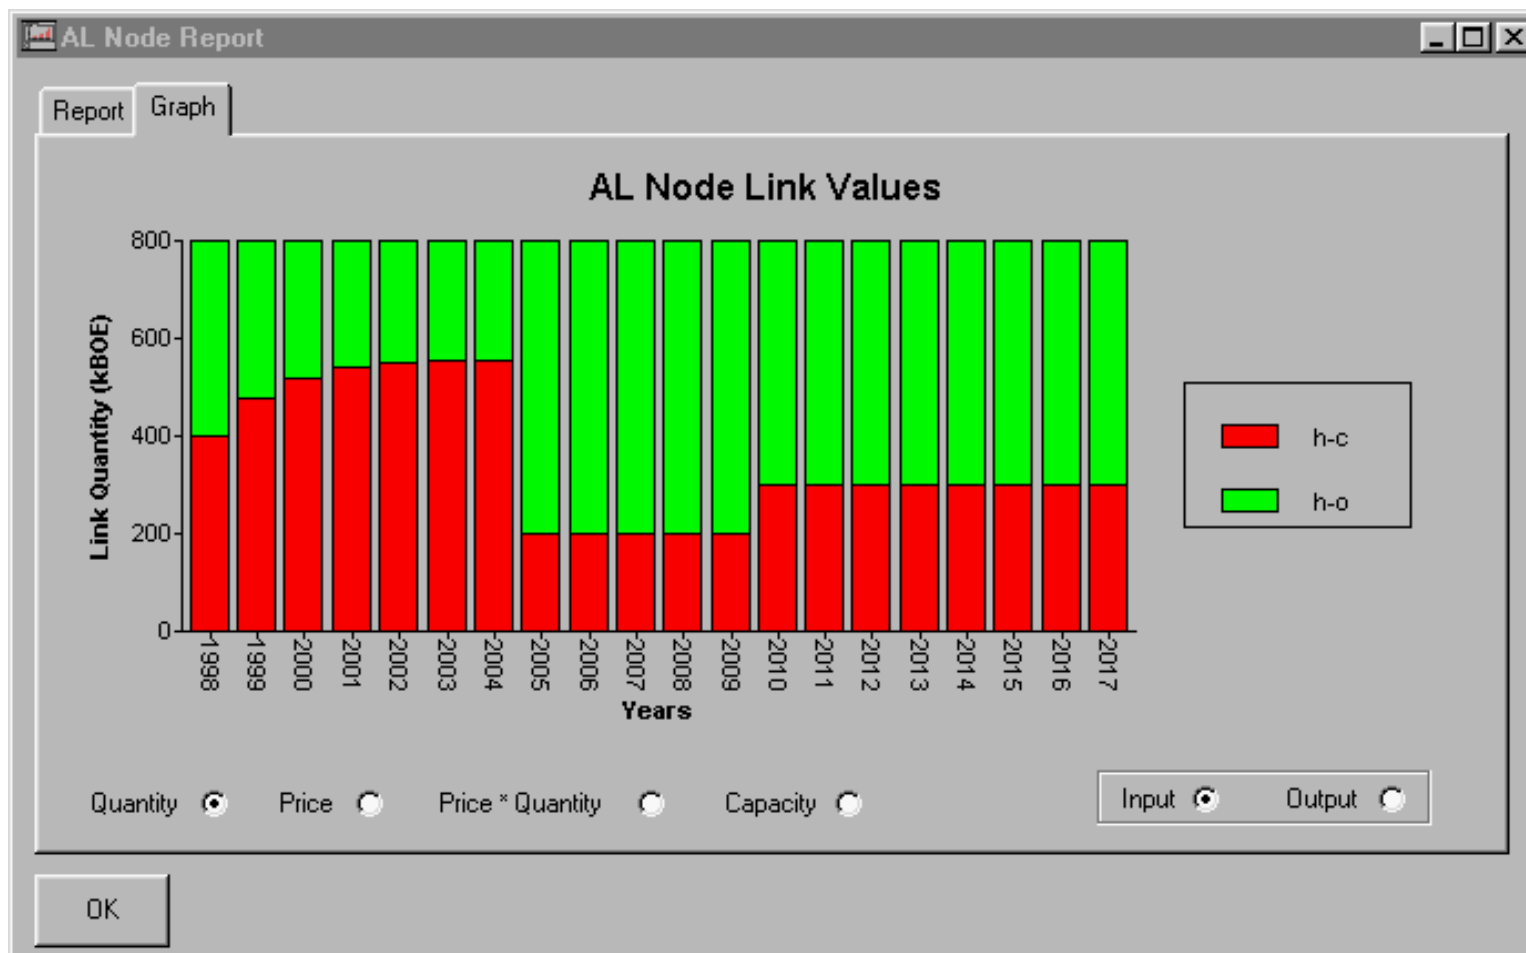

Case 15: Addition of a New HP2 Unit in 2005

Because the price on the link h-c becomes higher in 2005 and after, its market share decreases.

Case 16: H-C Link Capacity Limits

1998: No Limit, 2005: 200 kBOE, 2010: 300 kBOE

Case 17: Price Growth Rates of Energy Resources

Oil 2%, Coal 4%
